

SBV-1

SURFACE BREATHING VENT

GET FRESH AIR WITHOUT CO₂ BUILD-UP!

The **SBV** allows a diver to comfortably breathe air directly into the Oral/Nasal Cavity of a full-face mask without the risk of CO₂ buildup (unlike some of the visor mounted vents). The SBV design allows divers to stand fully operational on the surface without reducing their gas supply. The SBV is available for most full-face masks. The low profile of the SBV reduces the chance of an entanglement.

SBV-1 shown with the Sartek RSV-1 Redundant Supply Valve U.S. Pat. # 5,944,054

INSTALLATION IS EASY

To place the SBV on an AGA or Poseidon full face-mask, simply remove the communications port cover by removing the two screws that attach the cover. Replace the cover with the SBV and tighten the two screws.

AGA SBV

EXO SBV

SBV (U.S. Patent # 6,412,485)

A SAFE, SIMPLE, FLEXIBLE SOLUTION

The SBV is designed for divers utilizing a full-face mask. It is perfect for public safety divers that dress en route to a call. A diver can arrive fully dressed, mask on, ready to enter the water. Backup divers can maintain a ready position with the mask on, instead of placing the mask on only in the event of an emergency. This would eliminate the possibility of a backup diver rushing and placing the mask on improperly, wasting precious time during a life or death situation. For instructors, the SBV saves time and energy by allowing them to speak through the vent without having to remove their mask. With only one moving part maintenance is easy. Simply freshwater rinse the SBV along with the full-face mask. Periodically grease the “O” rings, and you’re done! The SBV is available for AGA®, Poseidon®, Ocean Reef® and EXO® full face masks. Sartek can retrofit your existing communication system into a SBV-1. This permits the use of a single communication unit between multiple and different Manufacturer’s masks, by simply purchasing an inexpensive adapter plate.
